PowerShell Script

Add 120 users across 3 departments; each department has its own OU.
Error handling check for users that already exist to avoid errors.
Set a default temporary password and force a password change on the next login.

```
# Import the Active Directory module
Import-Module ActiveDirectory

# Define your target Base DN (Change this to match your actual
domain, e.g., "DC=corp,DC=local")
$DomainDN = (Get-ADDomain).DistinguishedName

# Define Department OUs to create
$Departments = @("Finance", "IT", "Engineering")

Write-Host "--- Creating Organizational Units ---" -ForegroundColor
Cyan

foreach ($Dept in $Departments) {
    # Check if the OU already exists to prevent errors
    OUPath = "OU =Dept,$DomainDN"
    try {
        Get-ADOrganizationalUnit -Identity $OUPath -ErrorAction Stop
        Write-Host "OU already exists: $OUPath" -ForegroundColor
Yellow
    }
    catch {
        New-ADOrganizationalUnit -Name $Dept -Path $DomainDN
-ProtectedFromAccidentalDeletion $false
        Write-Host "Successfully created OU: $OUPath"
-ForegroundColor Green
    }
}

Write-Host "`n--- Creating 120 Total Users (40 per Department) ---"
-ForegroundColor Cyan

# Set a default secure password for the test accounts
$SecurePassword = ConvertTo-SecureString "P@ssw0rd123!" -AsPlainText
-Force

# Loop through each department and create 40 users
foreach ($Dept in $Departments) {
    OUPath = "OU =Dept,$DomainDN"
```

```
    for ($i = 1; $i -le 40; $i++) {
        # Format the number with leading zeros (e.g., User01, User40)
        $UserNum = $i.ToString("00")
        SamAccountName = "(Dept.ToLower())_user$UserNum"
        UserDisplayName = "Dept User $UserNum"
        UserPrincipalName = "SamAccountName@$((Get-ADDomain).DNSRoot)"

        # Check if user already exists
        if (Get-ADUser -Filter "SamAccountName -eq
'$SamAccountName'") {
            Write-Host "User already exists: $SamAccountName"
-ForegroundColor Yellow
            continue
        }

        # Create the user object
        New-ADUser `
            -Name $UserDisplayName `
            -SamAccountName $SamAccountName `
            -UserPrincipalName $UserPrincipalName `
            -Path $OUPath `
            -AccountPassword $SecurePassword `
            -Enabled $true `
            -ChangePasswordAtLogon $true

        Write-Host "Created: $UserDisplayName in $Dept"
-ForegroundColor Green
    }
}

Write-Host "`nScript execution completed! Created OUs and 120 total
users successfully." -ForegroundColor Cyan
```

Create sub-OUs for each OU that include users, computers, service accounts, and groups.

```
# Import the Active Directory module
Import-Module ActiveDirectory

# Dynamically get your domain Distinguished Name (or change it to
your custom string)
$DomainDN = (Get-ADDomain).DistinguishedName
```

```
# 1. Define Departments and Sub-OUs
$Departments = @("Finance", "IT", "Engineering")
$SubOUs      = @("Users", "Computers", "Groups", "Service Accounts")

Write-Host "--- Creating Department and Sub-OU Structure ---"
-ForegroundColor Cyan

foreach ($Dept in $Departments) {
    DeptOUPath = "OU =Dept,$DomainDN"

    # Check if the main Department OU exists; if not, create it
    try {
        Get-ADOrganizationalUnit -Identity $DeptOUPath -ErrorAction
Stop | Out-Null
        Write-Host "Department OU already exists: $Dept"
-ForegroundColor Yellow
    }
    catch {
        New-ADOrganizationalUnit -Name $Dept -Path $DomainDN
-ProtectedFromAccidentalDeletion $false
        Write-Host "Created Department OU: $Dept" -ForegroundColor
Green
    }

    # Loop through and create each Sub-OU inside the Department
    foreach ($SubOU in $SubOUs) {
        SubOUPath = "OU =SubOU,$DeptOUPath"

        try {
            Get-ADOrganizationalUnit -Identity $SubOUPath
-ErrorAction Stop | Out-Null
            Write-Host "   -> Sub-OU already exists: $SubOU"
-ForegroundColor Yellow
        }
        catch {
            New-ADOrganizationalUnit -Name $SubOU -Path $DeptOUPath
-ProtectedFromAccidentalDeletion $false
            Write-Host "   -> Created Sub-OU: $SubOU under $Dept"
-ForegroundColor Green
        }
    }
}
```

```
Write-Host "`nSub-OU structure creation completed!" -ForegroundColor
Cyan
```

Add the users you have created into the users folder in the sub-OUs

```
# Import the Active Directory module
Import-Module ActiveDirectory

$DomainDN = (Get-ADDomain).DistinguishedName
$Departments = @("Finance", "IT", "Engineering")

Write-Host "--- Moving Department Users to the 'Users' Sub-OU ---"
-ForegroundColor Cyan

foreach ($Dept in $Departments) {
    # Define source (department root) and target (Users sub-OU)
    SourceOU = "OU =Dept,$DomainDN"
    TargetOU = "OU = Users,OU =Dept,$DomainDN"

    # Find users located *directly* in the department root OU
    $UsersToMove = Get-ADUser -Filter * -SearchBase $SourceOU
-SearchScope OneLevel

    if ($UsersToMove) {
        foreach ($User in $UsersToMove) {
            try {
                Move-ADObject -Identity $User.DistinguishedName
-TargetPath $TargetOU -ErrorAction Stop
                Write-Host "Moved: (User.Name) -> $TargetOU"
-ForegroundColor Green
            }
            catch {
                Write-Host "Failed to move (User.Name): $_"
-ForegroundColor Red
            }
        }
    } else {
        Write-Host "No users found directly in $SourceOU (they may
have already been moved)." -ForegroundColor Yellow
    }
}

Write-Host "`nUser migration to Sub-OUs complete!" -ForegroundColor
Cyan
```
